light-yellow color (result of change of proteins of blood). In different sections of the nervous system large locations of necrosis were observed, but the cerebral cortex remained preserved. Necrotic changes were observed in the sex glands, and in the cortical layer of the adrenals. In the lungs and gastro-intestinal tract - vascular infections with phenomena of diapedesis were noted. In the lymphoid tissues impoverishment of the follicles by lymphoid elements was noted, a great quantity of large cells with basophil granulation in the cytoplasm which were macrophages were observed. In all cases with acute radiation sickness, universal change was observed of the structure of paraplastic substanz: protein saturation and homogeneity of the vessel walls, intermediate tissue of the kidneys, heart, stomach, coursening and lumpy decay of the reticular network of the lymphoid tissue and bone marrow.

TITLE: Intervuz Conferences on Science and Methods (Mezhvuzovskiye nauchnyye i metodicheskiye konferentsii) Electronic Accelerators (elektronnyye uskoriteli)

PERIODICAL: Vestnik Vysshey Shkoly, 1958, Nr 5, page 80 (USSR)

ABSTRACT: The Nauchno-tehnicheskiy sovet Ministerstva vysshego obrazovaniya SSSR (Scientific-Technical Council of the USSR Ministry of Higher Education) decided to convene in February 1958 in Tomsk an Intervuz Conference on Electronic Accelerators. Among the delegates were workers of important scientific institutions - the Mezhdunarodnyy ob'yedinennyi institut yadernykh issledovaniy (International Institute of Joint Nuclear Research), Fizicheskiy institut AN SSSR (Physics Institute of the USSR Academy of Sciences), Institut metallurgii AN SSSR (Institute of Metallurgy of the AS USSR Academy of Sciences), Institut biologicheskoy fiziki AN SSSR (Institute of Biological Physics of the AS USSR), Institut eksperimental'noy patologii i terapii raka AMN SSSR (Institute of Experimental Pathology and Therapy of Cancer, USSR Academy of Medical Sciences), Leningradskiy fiziko-tehnicheskiy in-

Electronic Accelerators

stitut AN SSSR (Leningrad Physico-Technical Institute of the AS USSR), and others. In the Section for Using Electronic Accelerators in Industry, Physics, Medicine and Biology, and in the Theoretical Section, the betatrons issued by the Tomskiy politekhnicheskiy institut (Tomsk Polytechnical Institute) were mentioned as being widely used in detecting of defects in metals, studying the reaction of charged particles on substance, and in medical treatment. The reports of workers of the Tomskiy meditsinskiy institut (Tomsk Medical Institute) Professor I.V. Toroptsev, Dotsent N.V. Sokolova and others on the diseases of animals caused by the radiation of betatrons of 10 and 15 Mev were heard with great interest. In the Theoretical Section, Professor A.A. Vorob'yev delivered a report on a new method of accelerating electrons to very high energies. This method is based on using running waves in closed wave guides. In conclusion the conference indicated ways for a wider use of betatrons in different branches of science and technique and for an improvement in their structure.

TITLE: Operating a 2-Wire-Ground-Return System

PERIODICAL: S. kh. Sev. Kavkaza, 1958, Nr 4, pp 86-87

ABSTRACT: Operating a 2-wire-ground-return system in the rural networks of Stavropol' kray revealed serious shortcomings. The principal difficulty lies in the fact that the insulation with respect to the ground of an ShD-35 insulator at 35 kv and an Sh-10 insulator at 10 kv has proved inadequate. Insulator failures often occur in humid weather, fog, or snow storm; they cause prolonged power interruptions. The impossibility of connecting a 2-wire-ground-return system in parallel with conventional lines, without special isolating transformers, as well as noise induced in communication circuits constitute other shortcomings. The need for special high-electric-strength

Card 1/2

TITLE: Improvement of the Method of Determining Chloride Salts in Petroleum

PERIODICAL: Novosti neft. tekhn. Neftepererabotka, 1958, Nr 8, pp 26-28

ABSTRACT: In connection with the insufficiently accurate, very laborious and time-consuming determination of chlorides in petroleum according to State Standard GOST 2401-47 a new method of this analysis has been developed. To 25 ml of petroleum, 10 ml of gasoline of direct distillation, 15-30 ml acetone, 250 ml of boiling distilled water are added and mixed for 5 min on a mechanical rocking device with 120 shakings per min. An aqueous extract is separated, filtered through a paper filter in the presence of H_2S , boiled to a negative test with lead paper, acidified by 0.2 n HNO_3 and titrated by a solution of mercury nitrate of 0.01 n with diphenylcarbazide as an indicator. Under described conditions a single extraction extracts 99.0% of chlorides, even if their content in petroleum is $\sim 27,000$ mg/l, and the titration with mercury nitrate yields more exact results

Card 1/2

TITLE: A method for producing phosphoro-potassium fertilizers. Class 16, No. 171-409

SOURCE: Byulleten' zobreteniy i tovarnykh znakov, no. 11, 1965, 31

TOPIC TAGS: fertilizer, phosphate, potassium

ABSTRACT: This Author's Certificate introduces a method for producing phosphoro-potassium fertilizers using cement dust (waste from cement production) as the potassium raw material. The process of adding potassium to the product is simplified and evaporation is prevented by using a 20% excess of an acid which directly neutralizes the cement dust for breaking down the phosphate raw material.

TITLE: The Synthesis of Monoalkylmaleates (sintez monoalkilmaleinatov)
PERIODICAL: Zhurnal prikladnoy khimii, 1959, Vol XXXII, Nr 7, p. 667-672
(USSR)

ABSTRACT: The derivatives of dibasic acids polymerize with various mono- and divinyl compounds. The monoesters of maleic acid are investigated here. They are prepared by the reaction of maleic anhydride and primary, secondary, tertiary alcohols of the aliphatic, cyclic and aromatic series. Monoethyl maleate is obtained from maleic anhydride and absolute ethyl alcohol. It is separated from the reaction mixture by potash, ether, alcohol, diluted hydrochloric acid etc. The optimum temperature for the reaction is 80°C. A lowering of the temperature to 60°C reduces the reaction rate considerably. A temperature increase leads to decomposition of the monoester. The monoesters of the maleic acid are colorless, transparent, viscous liquids with a characteristic odor. They are soluble in

AUTHOR: Toropygin, Ye.l., Aspirant

TITLE: Profiling cams with a combined law of motion of the follower

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. Mashinostroyeniye, no. 6, 1960, 16 - 24

TEXT: The author develops a new method of profiling cams by sections of ellipses which permits tracing the above directly on the blank. The pressure angle and the speed of the cam are regarded as fixed. Only the domain of accelerated motion of the follower is considered since the quantities corresponding to the domain of deceleration can be obtained by multiplication by the ratio of accelerations. The transition profile of the cam is successively supposed to have the form of a parabola, a circle and an ellipse. The equations of these curves are reduced to a form enabling their parameters to be compared; the parameters of the ellipse are determined accordingly. The changes in the cam dimensions due to replacement of the parabo-

Card 1/2

Profiling cams with a combined law ... S/145/60/000/006/008/015/XX
D221/D304

tic profile by an elliptic one are analyzed. Finally, the acceleration of the follower due to the change of cam profile is considered. A numerical example is given. The author concludes that elliptic profiles have an essential advantage over the circular ones for the pressure angles of 45° to 60° . TITLE: The problem of variations in sodium emission at twilight

SOURCE: Abastumani. Astrofizicheskaya observatoriya. Byulleten', no. 32, 1965, 165-182

TOPIC TAGS: sodium, solar radiation, astronomic observatory, twilight, spectral line, line intensity, solar radiation intensity

ABSTRACT: The results of a study of seasonal variations in the intensity of twilight sodium emission are given. The data were obtained in spectrographic observations in 1961, 1962, and 1963 at the Abastumani Astrophysical Observatory with SP-48 spectrographs. The elevation above sea level is 1700 m, $\phi = 41^{\circ}45'N$, $\lambda = 25^{\circ}51'E$. The spectrographic observations were made simultaneously in three directions: 1) in the solar vertical ($h = 20\text{--}25^\circ$); 2) to the north ($h = 23^\circ$); and 3) at the zenith. For the north direction, the principal maximum is observed in April and somewhat more weakly in November and in July. Unlike the observations in the solar vertical, the seasonal variations for morning and evening differ in the north direction. A study of the change in the elevation of the maximum of the emitting layer in two directions
